MY BACKEND WORK / AGENTPGO COLLABORATION

AgentPGO Backend

Run the development API, inspect trace ingestion, then add an SDK to an agent run.

QUICK START

Open: https://github.com/Auro-rium/agent-PGO

Run locally:

```
python -m venv .venv
.venv\Scripts\Activate.ps1
python -m pip install -e ".[dev]"
```

Next: python -m pytest -q
uvicorn apps.api.main:app --reload

YOUR FIRST SESSION

01 Clone the backend-v1 branch of AyushKJha/PGO_work. Use Python 3.11+ and activate a virtual environment.

02 Install development dependencies. Run the repository tests, then start the FastAPI service as shown above.

03 Open http://127.0.0.1:8000/docs. Protected endpoints require tenant-scoped credentials; configure them using the project docs.

04 Follow packages/sdk-py/README.md or the TypeScript SDK docs for a small connector integration. Send metadata-only traces to the configured OTLP endpoint.

05 Inspect profiling and evaluation output, then export recommendations for review. Keep production routing under your own control.

DATA AND PRIVACY

Connectors record operational metadata by default, not prompt or response content. Keep keys out of source and logs. The development server is not a production deployment.

LIMITS TO KEEP IN MIND

Replay benchmarks are historical-report proxies, not fresh provider benchmarks. Live runs require provider credentials and usage/latency evidence.
